Dear Sir:

I think that spyware should not be allowed to be put on any computer whatsoever. Internet providers should put that spyware protection software on their server so that customers of their services will be always protected from spyware, eliminating the need to download a separate piece of software.

As I myself have a cable connection, Cox should take more preventitive measures to prevent spyware from being such a crisis for people who use their network for Internet services. One thing I do not like about spyware being installed on computers is that hackers are able to get into a person's computer and find out informaiton such as their social security number, address, telephone number, etc and use those records for vogus purposes and get fined for doing malicious activity and get penalized.

Mark
