

Bio Statement

OCEAN SOLAR, LLC

William L. Driscoll, President/Owner

FEIN: 45-3846045 NJHIC# 13VH08323400

Ocean Solar was founded in 2011 by William Driscoll.

William holds degrees from Harvard, Loyola Marymount, and Stockton Universities. William entered the renewable energy profession with the passion and motivation to help our country reduce its dependence on fossil fuels and create a cleaner greener future for our nation.

Ocean Solar has worked on over 10 MW of solar projects in the states of New York, New Jersey, and Pennsylvania. Ocean Solar's commitment to American-made products and exceptional customer service, separates them from other companies in the residential and commercial solar pv markets. Some of Ocean Solar's projects include full EPC services, as well as interconnection approvals, project management, and long-term O&M and SREC contracting.

A partial list of projects include:

Renaissance Marble Commercial Solar Rooftop, 325Kw O&M, Blackwood New Jersey

Lerro Properties, 4 Separate Commercial Rooftop Installations, 500 KW, Wildwood, New Jersey

Currently developing 6 solar projects for a GC in VA for the US Dept. of Fish and Wildlife.

Multiple residential solar projects in Pennsylvania and New Jersey totaling over 300 KW. These project include both, roof mounted, as well as, ground mounted solar arrays. The ground mounted arrays use a helio pile method that eliminates the need for cumbersome and often times, irremovable concrete pilings.

Ocean Solar's consulting department shares its experience and knowledge with some of the top financial institutions in the world. Ocean Solar works with these financial institutions on a consulting basis in predicting market trends, analyzing past performance, helping achieve long-term and stable visibility in both the private investment and yield co-fund renewable energy sectors.

Ocean Solar's founder, William L. Driscoll, recently formed a non-profit entity, appropriately named, The Driscoll Foundation. The Driscoll Foundation works to relieve the economic burden on families whom experience high energy costs. The foundation works to alleviate some of

the high costs of electricity through simple applications such as light bulb upgrading and also through, not so simple applications, such as total solar pv system integration to economically challenged families. The foundation is in its early development phase and is planning on installing its first donated solar array in the second quarter of 2016.
