

Do Mergers and Acquisitions Improve Efficiency: Evidence from Power Plants

Mert Demirer and Omer Karaduman

MIT Sloan and Stanford GSB

November 2022

Remarkably little evidence on how M&A affect efficiency

Literature primarily focused on market power effects of mergers

Important for

- **Antitrust:** Trade-off between **increased market power** and **efficiency**
- **Productivity Growth:** Do ownership changes allocate assets to more efficient firms?

Why little evidence? Primarily data limitations

- Typically, **revenue productivity** is observed, not **physical productivity**
- Hard to separate true efficiency from **market power**, **buyer power** and **quality** changes

[This paper:](#) Evidence from Power Plants

❶ Do mergers increase efficiency?

What predicts efficiency gains?

What are the mechanisms?

❷ How do mergers reallocate assets between firms?

Do mergers transfer assets to more productive uses?

Are buyers more efficient than sellers?

❸ What do firms do?

Process improvements or capital upgrades?

Evidence from **fossil fuel power plant** acquisitions in the US

- Retrospective study (2000-2020) using all US power plant acquisitions
- A cumulative 95% of total capacity changed hands in the sample period
- About 4000 majority ownership changes of production units

Difference-in-differences in a **data-rich environment**

- High-frequency data: hourly input, production and productivity
- Estimation at the production unit level

Universe of ownership changes during the study period

- Minority and Majority Share Ownership Changes
- Corporate Structure: Parent level, subsidiary level

The data does not have the revenue-is-output problem

- Physical output and input quantities observed, not revenues and expenditures
- Homogeneous product: No quality changes
- Clearly defined efficiency measure: Fuel efficiency
- High-Frequency Data: Hourly Input and Output
- Actual input/output, not survey-based

Important Industry

- Contributes to around 5 percent of GDP
- Positive Externalities: increasing efficiency reduces CO₂ emissions

- ▶ How do mergers affect efficiency: **Increase by 4 percent**
 - 75% of efficiency gain is explained by increase in productive efficiency
 - 25% is explained by improved capacity utilization and portfolio effects

- ▶ How do mergers reallocate resources: **Efficiently**
 - High productive firms buy from low productive firms
 - Target firms are selling their under-performing assets

- ▶ What do firms do: **Operational Improvements**
 - After the acquisitions, 55% power plants get a new plant manager
 - No evidence for increase in capital expenditures or labor

⑤ Mechanisms

⑥ Conclusion

Power plants turn one form of energy into electricity. In 2019

- Natural Gas (33%), Coal (32%), Nuclear (19%), Renewables (16%)
- ▶ We focus on thermal (gas and coal-fired) power plants

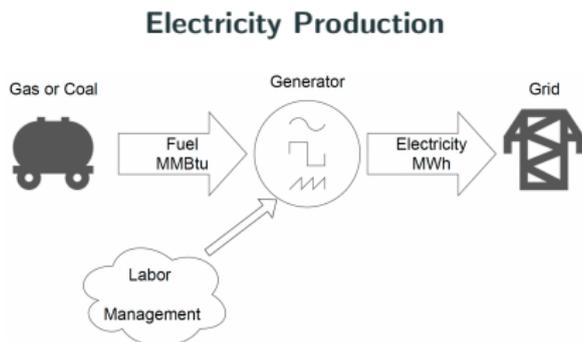

Electricity generation

- A power plant includes multiple generators
- ▶ Our unit of observation is generator

Electricity released to the grid

- Priced through a competitive bidding market: two-thirds of the market
- Regulated return: third of the market

Generator is the unit of production

Efficiency is measured by **inverse heat rate**: $\frac{\text{Energy Output (MWh)}}{\text{Energy Input (MMBtu)}}$

Fuel is 80 percent of operational cost

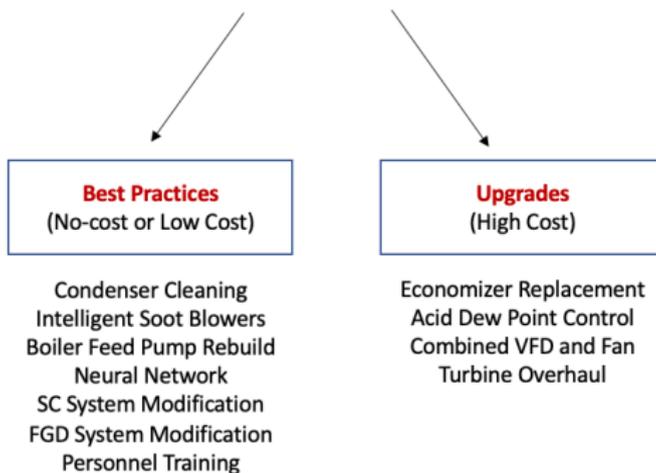

Advantage:

Physical output/physical input: Not confounded by buyer/market power changes

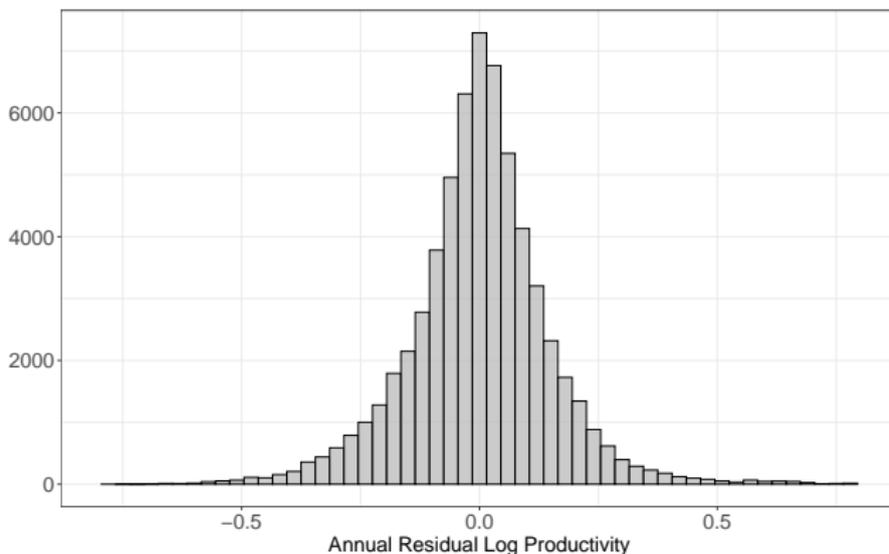

What Firms do to Improve Heat Rate

“I have never visited a power plant where significant improvements in energy efficiency could not be made” (Industry Expert, Power Magazine (2015))

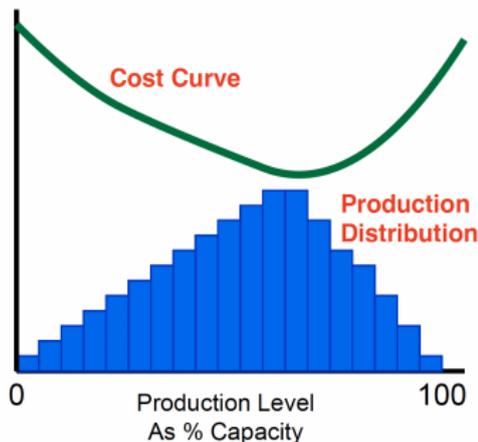

Two Main Ways to Improve Productivity

Distribution of Residual Log Productivity

- ▶ Controls for plant age, fuel type, technology, capacity, generator manufacturer, generator model, emission controllers

- ▶ Productivity changes with the production level
- ▶ Efficient Scale
- ▶ Ramp-up and ramp-down efficiency loss

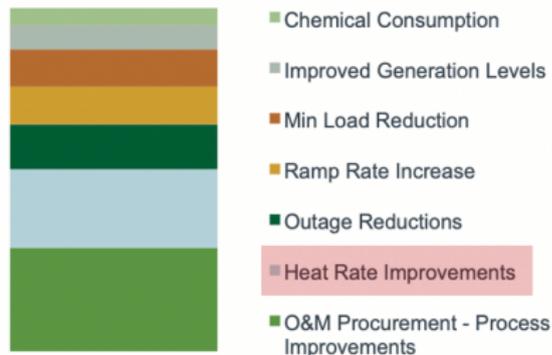

Some Sources of Efficiency Gain

- Change in the cost curve
- Operating close to the efficient scale (less ramp-up and ramp-down)
- Portfolio Effects (Synergies)

Acquirers often Make Claims about Heat Rate Improvements

A slide from investor presentation of Dynergy and Vista Energy Merger

Projected Operational Improvements **\$125mm**

Acquisition of Dynergy by Vista Energy (2018, \$1.74 billion deal)

- Heat Rate Improvement of \approx 50 million dollars

⑤ Mechanisms

⑥ Conclusion

Production Data (2000-2020)

Data Source: Environmental Protection Agency (EPA), Energy Information Administration (EIA), Velocity Suite and S&P Global for 2000-2020

Input-Output Data

- Hourly Input, Output, Emissions

Generator Data

- Age, Model, Manufacturer, Fuel Type, Capacity, Location

Personnel Changes

- Plant Managers, Engineers, Regulation Compliance Managers

Input Data

- Input Types, Suppliers, Prices, Transportation Mode, Quality (Coal)

Industry and Market Data

- Prices, Regulation Status, Demand, Market Shares

Data Source: S&P Global and Capital IQ

Deal Data

- All transactions that involve power plants
- Deal Size, Buyer, Seller, Announcement and Close Date, Conference Call Transcripts, Deal Description

Ownership Data

- Time series data on all shareholders of power plants

Corporate Structure

- Parent Company and Subsidiaries

Company Financials

- Asset Size, Sales, Profit, Assets Composition

① Industry

② Data

③ Mergers and Acquisitions

Summary Statistics

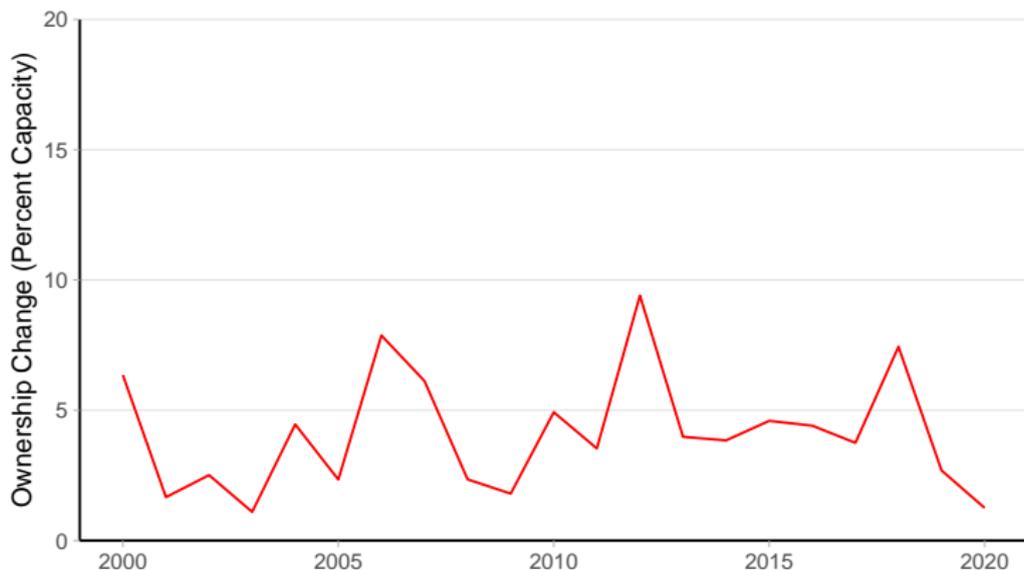

Mergers and Acquisition Types

④ Empirical Model

⑤ Mechanism

⑥ Conclusion

Ownership Change

► 95% of industry capacity changed ownership (50% distinct)

Summary Statistics: Mergers and Acquisitions

	All	Change in Majority Owner
<i>Unit Characteristics</i>		
# of Units	4834	4030
# of Plants	1567	1264
# of Acquirer Firms	267	234
# of Target Firms	266	229
<i>Firm Characteristics</i>		
Acquirer Capacity (MW)	5459	5055
Target Capacity (MW)	7025	6912
<i>Transaction Characteristics</i>		
# of Deals	689	532
Deal Size in # of Units	7.0	7.6

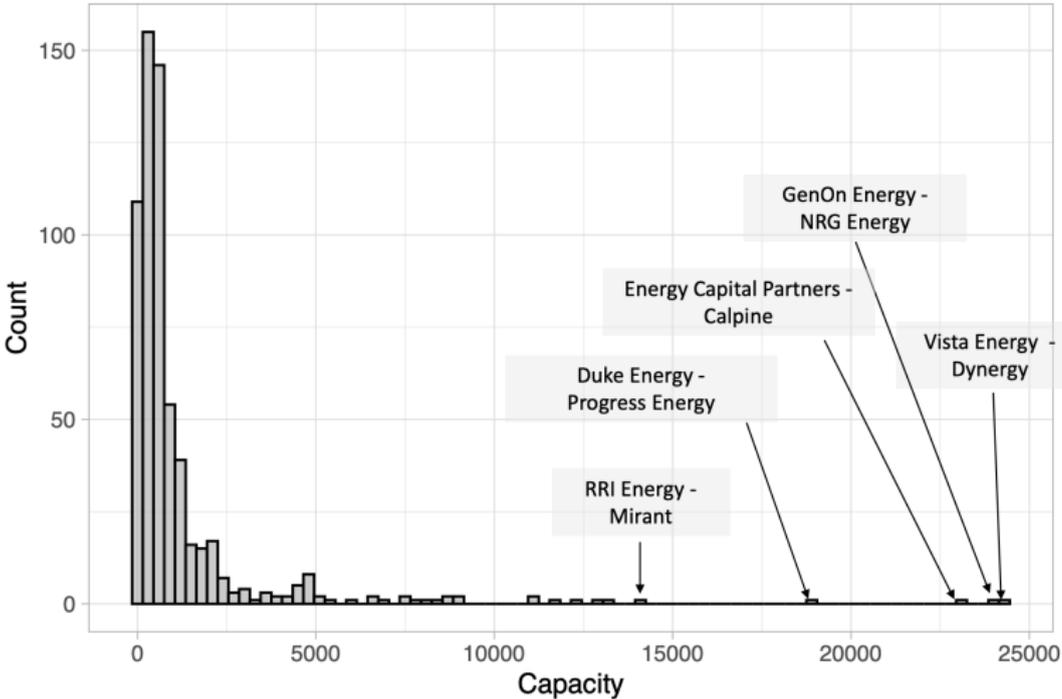

- ▶ Entry and exit in the market
- ▶ 64 percent of transactions are between incumbent firms

▶ Capacity Decrease

▶ Capacity Increase

Distribution of Deal Sizes

Distribution of Capacity that Changes Ownership in Transactions

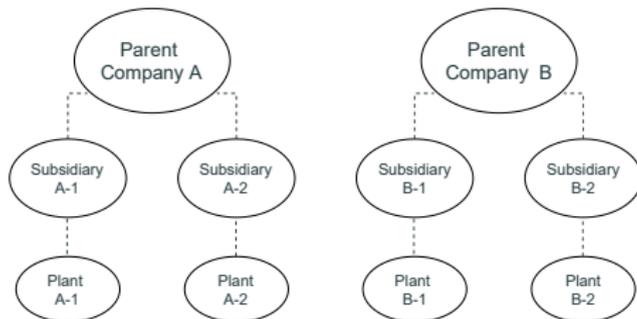

Ownership can change

- At the parent company level only
- At the parent company and owner level

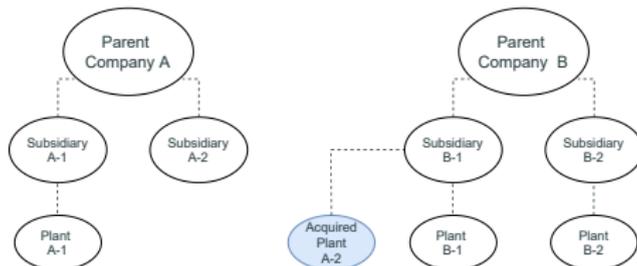

Classification of M&A

- ➊ Asset Acquisitions (Power Plant)
- ➋ Acquisitions of a subsidiary of another (parent) company
- ➌ Merger/Acquisitions of Entire Company

Pre-merger

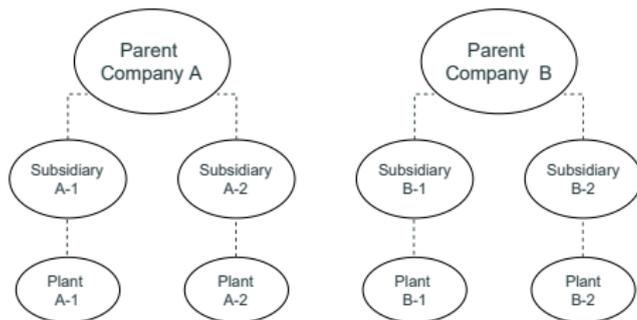

Post-merger

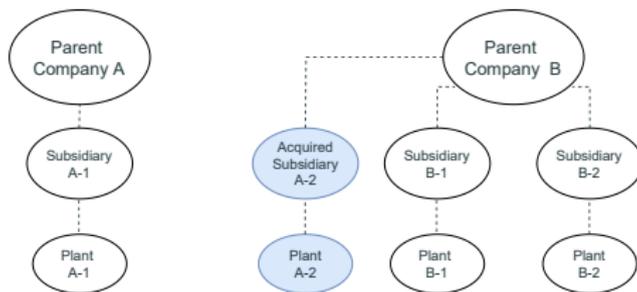

Subsidiary Acquisitions

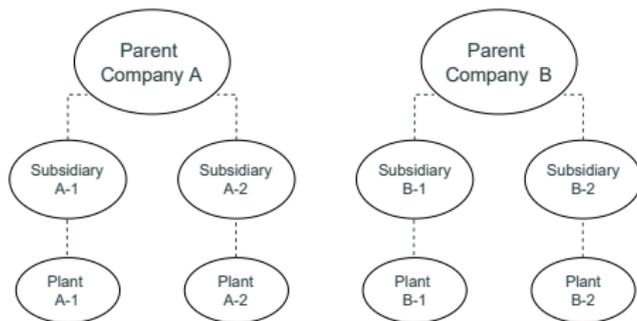

Pre-merger

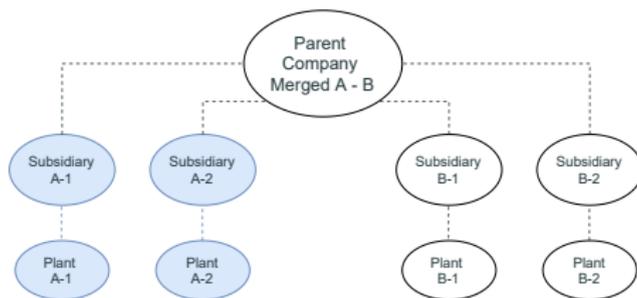

Post-merger

Pre-merger

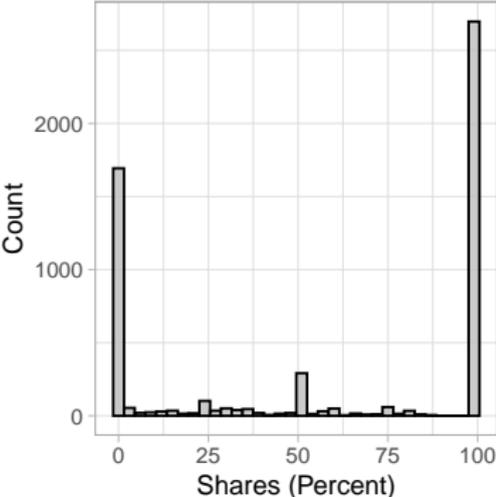

Post-merger

③ Mergers and Acquisitions

④ Empirical Model and Results

Difference-in-differences Estimation

What Predicts Efficiency Gains

Who Acquires Whom?

⑤ Mechanisms

⑥ Conclusion

DiD: Estimate how productivity changes after the acquisition

$$\log(y_{it}) = \theta_1 \text{pre_late}_{it} + \theta_2 \text{early_post}_{it} + \theta_3 \text{late_post}_{it} + \beta X_{it} + \mu_t + \alpha_i + \eta_{ijt}$$

- y_{it} productivity (inverse heat rate)
- Weekly data, at the unit level (i:unit, t:week)
- **pre_late:** 1-5 months before the merger, **early_post:** 1-5 months after the merger, **late_post:** 6-10 months after the merger
- Controls: generator characteristics, state-month and week fixed effects
- pre_early_acq is normalized to zero
- Only use the first acquisition if a unit is acquired multiple times

Concern: Mergers might be endogenous

- ▶ Ownership change is **discrete**
- ▶ Any productivity trend that might lead to selection is **gradual**
- ▶ Rich set of controls and placebo tests

Table: Regression Results

Dep Var:	Log Productivity
	All M&A
<i>Late pre-acquisition</i>	0.002 (0.006)
<i>Early post-acquisition</i>	0.000 (0.005)
<i>Late post-acquisition</i>	0.017 (0.006)
# of Obs.	1.79M
Adj. R^2	0.622
# of Acq.	1760

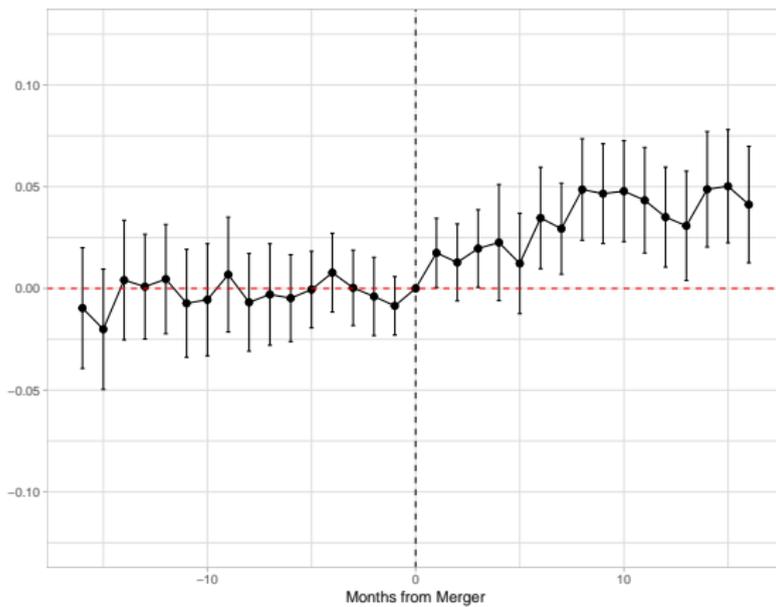

- Comparison: Avg. within-unit annual efficiency increase: 0.2 percent

Table: Regression Results

Dep Var:	Log Productivity		
	All M&A	Owner/Parent Company Change	Only Parent Company Change
<i>Late pre-acquisition</i>	0.002 (0.006)	-0.003 (0.008)	-0.003 (0.007)
<i>Early post-acquisition</i>	0.000 (0.005)	0.005 (0.007)	-0.002 (0.007)
<i>Late post-acquisition</i>	0.017 (0.006)	0.039 (0.012)	-0.006 (0.007)
# of Obs.	1.79M	1.38M	1.4M
Adj. R^2	0.622	0.635	0.622
# of Acq.	1760	897	921

- Only Parent and Owner Company change is effective

Change in Log Productivity

► Placebo Tests

- Zero Effects of Minority Acquisitions
- Zero Effects of Company Name Changes

► Robustness Checks

- Matching Estimator
- Estimation with daily and hourly data
- Callaway and Sant'Anna (2021) estimator

► Other important changes without mergers

- Manager changes without a merger \Rightarrow only 0.6 percent efficiency increase

What Merger Attributes Predicts Efficiency Gains?

Efficiencies are difficult to evaluate ex ante but factor into merger decisions

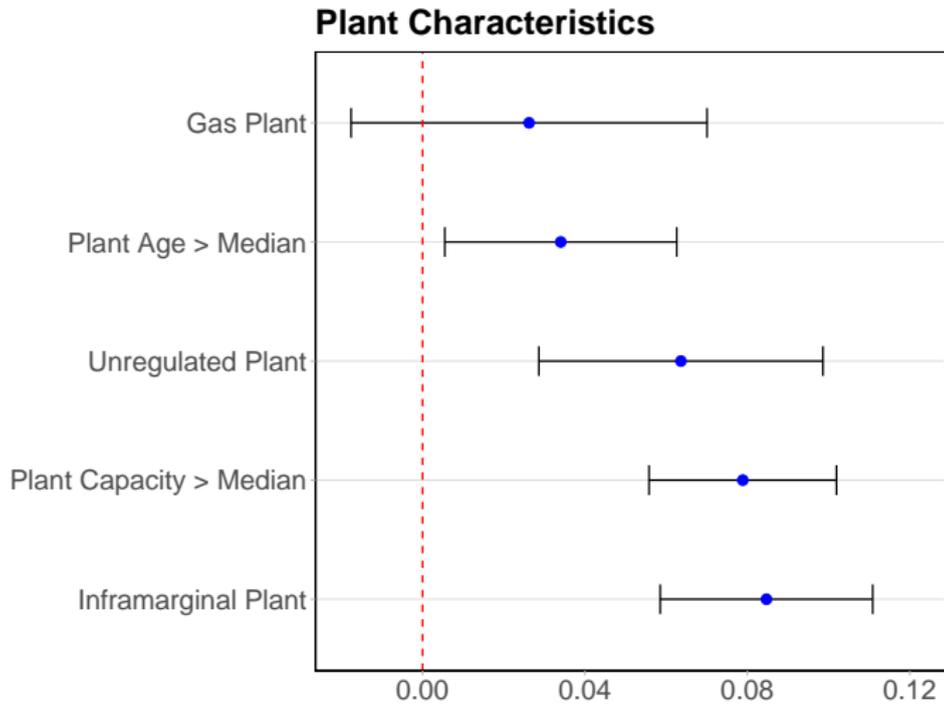

Identifying the sources of efficiency gains is important for potential merger evaluations

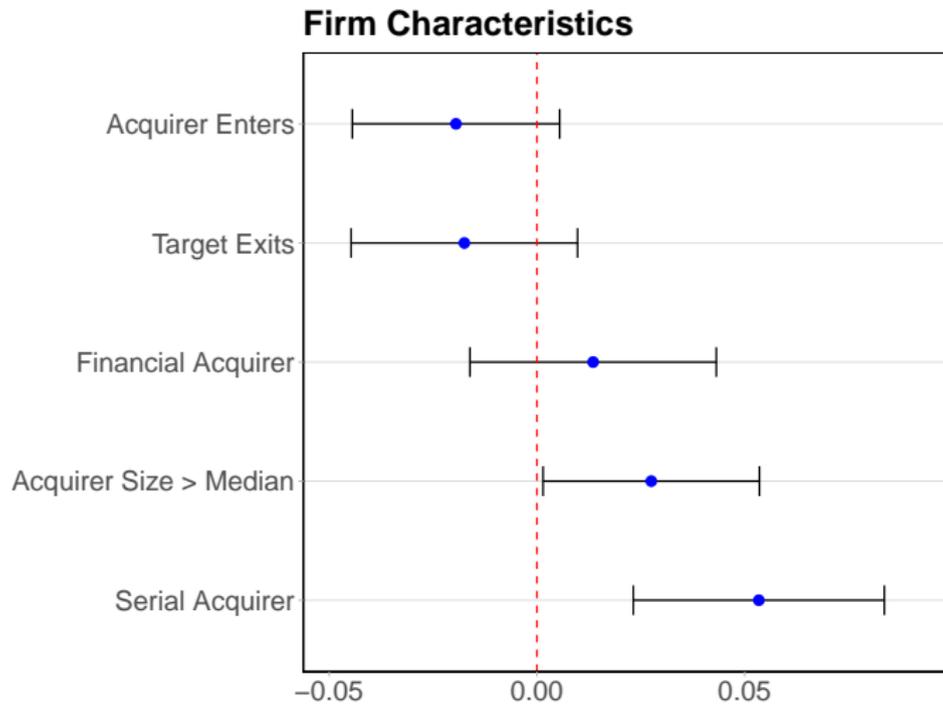

What merger attributes predict efficiency gains?

- Plant Characteristics
- Acquirer and Target Firm Characteristics
- Deal Characteristics

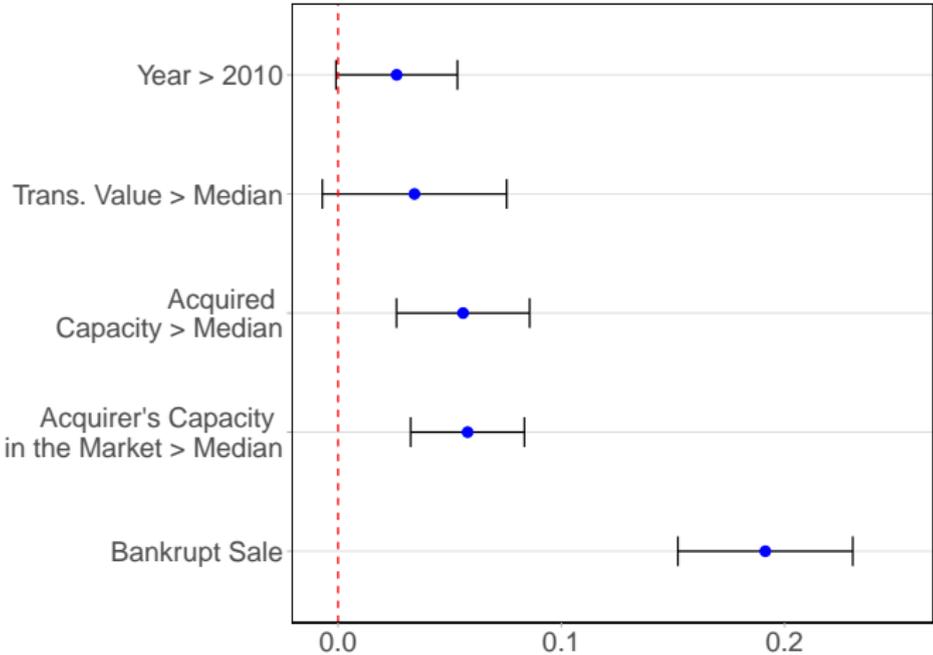

Estimate:

$$\log(y_{it}) = \theta_1 \text{treated}_{it} + \theta_2 \text{treated}_{it} \times \mathbf{Z}_{it} + \mathbf{X}_{it} + \mu_t + \alpha_i + \eta_{ijt}$$

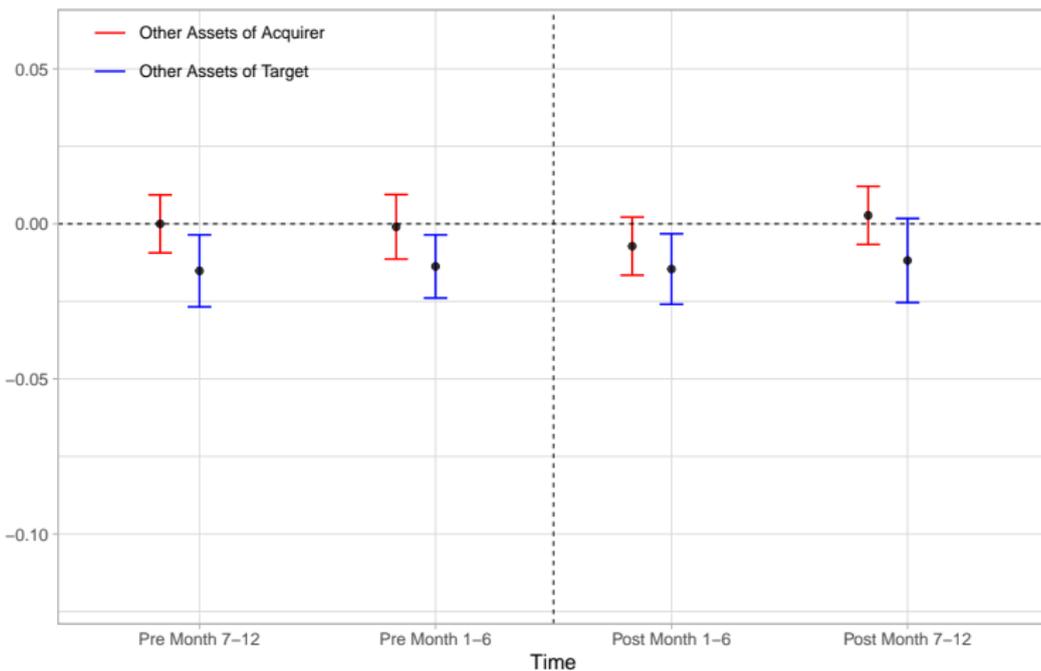

Transaction Characteristics

How do Mergers Reallocate Resources?

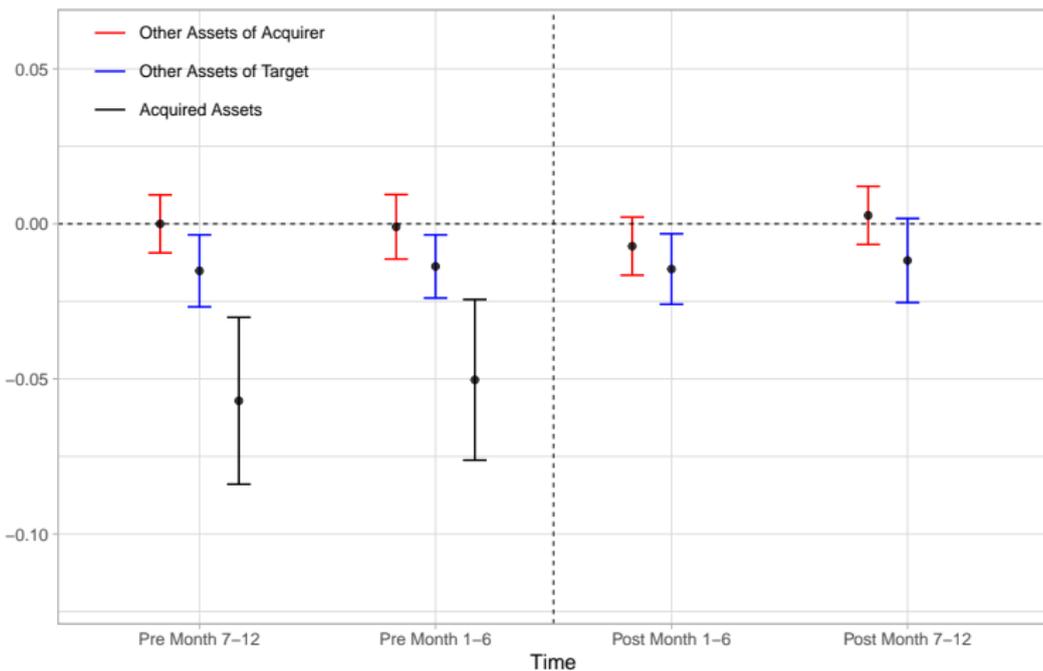

- ▶ Important feature of acquisitions: Asset reallocation between incumbent firms
 - 64 percent of transactions target firms sell part of their portfolio and acquiring firm has existing assets
- ▶ **Questions:** (i) Who acquires whom, (ii) What assets do target firms sell?
- ▶ **Goal:** Around the time of acquisition, compare the productivity levels of
 - ▶ Existing Assets of Acquirers
 - ▶ Existing Assets of Targets
 - ▶ Acquired Assets
- ▶ Estimate DiD with three sets of treatment dummies

Efficiency of Acquirer and Target

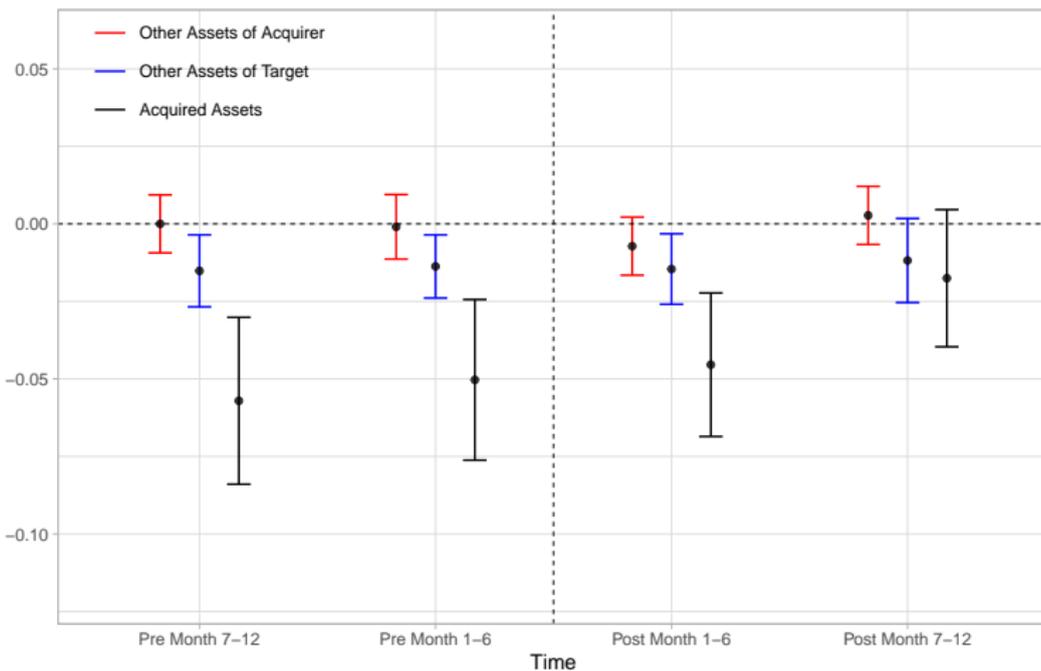

► More efficient firms buy from less efficient firms

Efficiency of Acquirer, Target and Acquired Assets

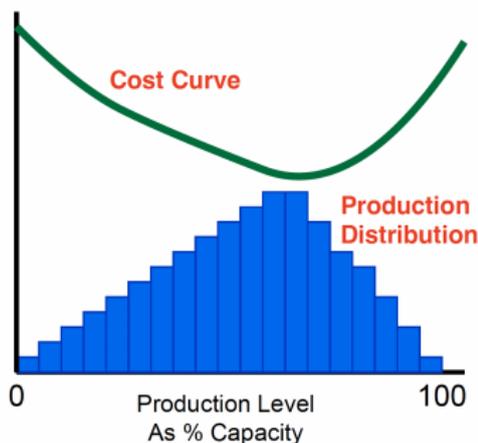

► Target firm is selling under-performing assets

Efficiency of Acquirer, Target and Acquired Assets

► Efficiency of Acquired Assets Increase

- ① Industry
- ② Data
- ③ M&A
- ④ Empirical Model and Results
- ⑤ Mechanisms
 - Sources of Efficiency Gains
 - What Do Acquirer Firms Do?
- ⑥ Conclusion

Three Sources of Efficiency Gains

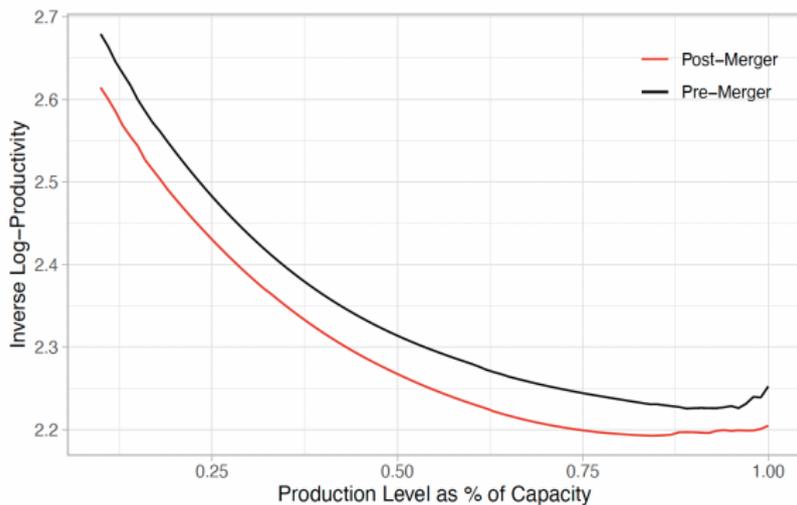

- ① Productive Efficiency
- ② Improved Capacity Utilization
- ③ Portfolio Effects (Synergies)

- ▶ Develop predictions and test these sources of efficiency gains
 - **Prediction 1:** Cost curve shifts down at every production level
 - **Prediction 2:** Standard deviation of heat rate goes down
 - **Prediction 3:** Efficiency of the existing plants of the acquirer firm in the same market will improve

Cost Curve

Estimate cost curve pre- and post-merger (one year) nonparametrically

Controlling for ramp-up and ramp-down (production in previous two hours)

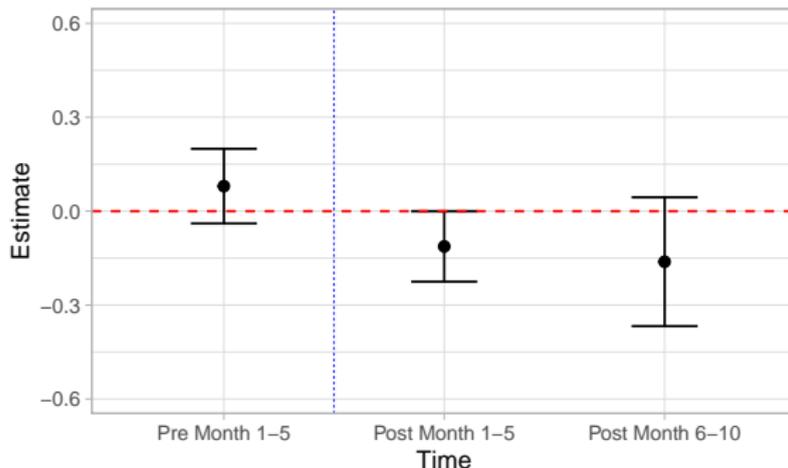

► Average 2.9 percent gain through productive efficiency (75% of total)

Improvements in Capacity Utilization

Improved in capacity management implies a decline in volatility of heat rate
Focus on acquisitions where acquirer has no existing plants in the market to rule out synergies

Effects of M&A on Standard Deviation of Heat Rate

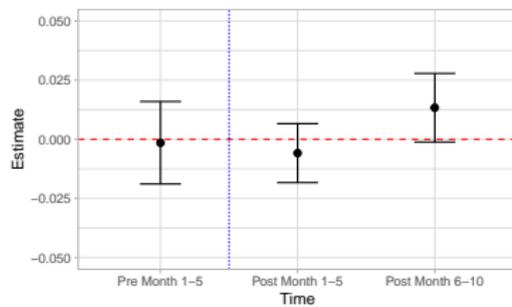

Portfolio effects implies for the existing generators of the acquirer

Efficiency improvements of the portfolio in the **same market**

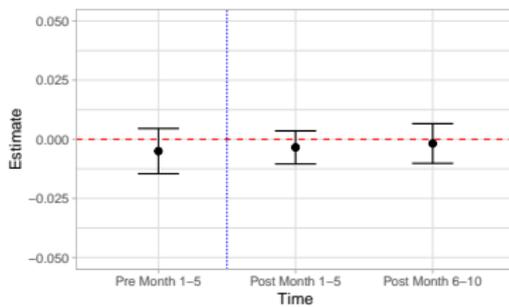

No change in **different markets**

Diff-in-diff: Existing portfolio of the acquirer firms is treated

(a) Same Market

(b) Different Market

What increases productive efficiency? Two potential hypotheses

- Process Improvements: **knowledge transfer**
- Capital Upgrades: **liquidity constraints**

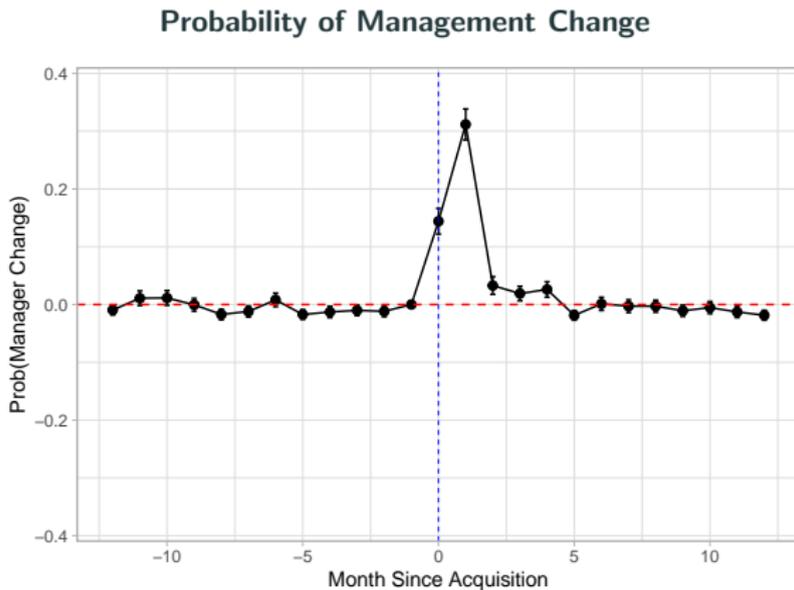

Additional data on operation and production

- Manager changes (name and date)
- Annual non-fuel costs, labor and capital expenditure

Question: How do management and other costs change after the acquisition?

Difference-in-differences estimation with outcomes:

- (i) Manager changes, (ii) Non-fuel cost, labor and capital expenditures

- ▶ 55% of acquirers replace plant manager within three months

Labor and Capital Change After the Merger

Diff-in-diff estimation. Outcome variables are the logarithm of

- Non-fuel variable cost per MWh
- Number of Employees
- Capital Expenditures

Annual data for a sample of plants reporting to FERC

	Non-fuel Cost	Number of Employees	Capital Expenditures
Post-Merger	-0.068	-0.054	-0.020
S.E	(0.053)	(0.031)	(0.032)
# of Acq	655	584	678
# of Obs	29325	26866	29418
R^2	0.62	0.92	0.86

Evidence of efficiency gains from power plant M&A

4 percent efficiency gains 5-7 months after acquisition

Who Acquires What Assets from Whom?

Efficient firms buy assets from less efficient firms.

Sellers sell under-performing assets

What mechanisms generate efficiency gains?

Productive Efficiency: 75 percent

Evidence for adopting best practices rather than costly investment
